APPROVAL BLOCK, AND REVISION CHANGES
1.0 SCOPE
This specification defines the physical interface of the Serial ATA (Attach Technology) Connector. Serial ATA is a high-speed serial link replacement for the parallel ATA attachment of mass storage devices interfacing with no need of changes with its current system. The serial link employed is a high-speed differential layer that utilizes Gigabit technology and 8b/10b encoding. The Serial ATA connector is compatible with the Serial ATA cable, consisting of 2 parallel pair, available in 26AWG and 30AWG, each pair shielded with a flex PVC jacket.

2.0 APPLICABLE DOCUMENTS
Reference documents listed below shall be the latest revision unless otherwise specified. Should a conflict occur between this specification and any of the listed documents then this specification shall prevail

2.1 Regulatory Requirements
- Be an UL, C-UL Recognized Component
- Housing plastics must be rate UL 94V0

2.2 Industry Standards
- Serial ATA High Speed Serialized AT Attachment, Revision 1.0
- EIA-364, Electrical Connector Test Procedures
- CA Serial ATA Drawings
CA - U709000 -X X - X - XXX

SERIAL ATA CABLE ASSEMBLY

CONNECTOR STYLE
0 = STRAIGHT, BOTH ENDS
1 = STRAIGHT TO RIGHT ANGLE (KEY IN)
2 = RIGHT ANGLE, SAME DIRECTION
3 = STRAIGHT TO RIGHT ANGLE (KEY OUT)
4 = RIGHT ANGLE, UP & DOWN (KEY IN)
5 = RIGHT ANGLE, UP & DOWN (KEY OUT)

CONTACT PLATING
A = GOLD FLASH
D = .000005" AU
C = .000015" AU
F = .000030" AU

CABLE TYPE
0 = 26 AWG (HCM-40405-4)
1 = 30 AWG (HCM-40404-4)

LENGTH
DIM 'A'

UNIT
BLANK = INCHES
M = METERS

2. TOLERANCE: ±1" [.025M] FOR CABLE LENGTH UP TO 30" [.76M]

REFER TO CA DWG. NO. T610110 FOR CONNECTOR ASSEMBLY,
CA DWG. NO. 10766 FOR OVERMOLD DETAILS.

NOTES: UNLESS OTHERWISE SPECIFIED
3.0 APPLICATION FEATURES

3.1 Environmental
   Temperature Range: -20° to +85°C

3.2 Mechanical
   Durability: 50 Cycles
   Insulator Material: Thermoplastic compounds, UL94V-0
   Contact Material: Copper Alloy
   Contact Plating:  
     C = Contact Area: .000015” Gold  
     D = Contact Area: .000005” Gold  
     A = Contact Area: .000001” Gold  
     F = Contact Area: .000030” Gold  
   All With: Solder Area: .000150” Tin  
   Underplate: .000075” Nickel

3.3 Electrical
   Current Rating: 1 Amp  
   Insulation Resistance: >1000 MΩ  
   Contact Resistance: <30 mΩ (<45mΩ after stress)

4.0 CONNECTOR AND CABLE ASSEMBLY REQUIREMENTS AND TEST PROCEDURES:
   Unless otherwise specified, all measurements shall be performed within the following lab conditions:
   • Mated
   • Temperature 15° to 35° C
   • Relative Humidity 20% to 80%
   • Atmospheric Pressure 650mm to 800mm of Hg
### Table 4.1 – Signal Integrity Requirements and Test Procedures

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Procedure</th>
<th>Requirements</th>
</tr>
</thead>
</table>
| **Mated Connector Impedance** | 1. Minimize skew (see NOTE 1).  
2. Set the Time Domain Reflectometer (TDR) pulsers in differential mode with a positive going pulse (V+) and a negative going pulse (V-). Define a reflected differential trace: \( V_{\text{diff}} = V_+ - V_- \).  
3. With the TDR connected to the risetime reference trace, verify an input risetime of 70ps (measured 20%-80% Vp). Filtering may be used to slow the system down (see NOTE 2).  
4. Connect the TDR to the sample measurement traces. Calibrate the instrument and system (see NOTE 3).  
5. Measure and record the maximum and minimum values of the near end connector impedance. | 100 Ω ± 15%  |
| **Cable Absolute Impedance**  | 1. Set the Time Domain Reflectometer (TDR) pulsers in differential mode with a positive going pulse (V+) and a negative going pulse (V-). Define a reflected differential trace: \( V_{\text{diff}} = V_+ - V_- \).  
3. With the TDR connected to the risetime reference trace, verify an input risetime of 70ps (measured 20%-80% Vp). Filtering may be used to slow the system down (see NOTE 2).  
4. Connect the TDR to the sample measurement traces. Calibrate the instrument (see NOTE 3).  
5. Measure and record maximum and minimum cable impedance values in the first 500 ps of cable response following any vestige of the connector response. | 100 Ω ± 10%  |
| **Cable Pair Matching**       | 1. Set the Time Domain Reflectometer (TDR) to differential mode.  
2. With the TDR connected to the risetime reference traces verify an input risetime of 70 ps (measured 20%-80% Vp). Filtering may be used to slow the system down (see NOTE 2).  
3. Connect the TDR to the sample measurement traces. Calibrate the instrument and system (see NOTE 3).  
4. Measure and record the single-ended cable impedance of each cable within a pair. Measure and record maximum and minimum cable impedance values in the first 500 ps of cable response following any vestige of the connector response.  
5. The parameter then equals Line 1\(_{\text{imp}}\) – Line 2\(_{\text{imp}}\). | ± 5 Ω        |
| **Common Mode Impedance**     | 1. Set two TDR pulsers to produce a differential signal.  
2. Minimize skew (see NOTE 1).  
3. With the TDR connected to the risetime reference trace verify an input risetime of 70 ps (measured 20%-80%). Filtering may be used to slow the system down (see NOTE 2).  
4. Calibrate the TDR (see NOTE 3).  
5. Set both TDR pulsers to produce positive going pulses.  
6. Measure the even mode impedance of the first pulser. Divide this by 2 to get the common mode impedance.  
7. Do the same for the other pulser. Both values shall meet the requirement | 25 to 40 Ω   |
| **Insertion Loss**            | 1. Produce a differential signal with the signal source (see NOTE 4).  
2. Assure that skew between the pairs is minimized. (see NOTE 1).  
3. Measure and store the insertion loss (IL) of the fixturing, using the IL reference traces provided on the board, over a frequency range of 10 to 4500 MHz.  
4. Measure and record the IL of the sample, which includes fixturing IL, over a frequency range of 10 to 4500 MHz.  
5. The IL of the sample is then the results of procedure 4 minus the results of procedure 3. | 6 dB max.     |
| **Crosstalk: NEXT**           | 1. Produce a differential signal with the signal source (see NOTE 1).  
2. Connect the source to the risetime reference traces. Assure that skew between the pairs is minimized. (see NOTE 1).  
3. Terminate the far ends of the reference trace with loads of characteristic impedance.  
4. Measure and record the system and fixturing crosstalk. This is the noise floor.  
5. Terminate the far ends of the drive and listen lines with loads of characteristic impedance.  
6. Connect the source to the drive pair and the receiver to the near-end of the listen pair.  
7. Measure the NEXT over a frequency range of 10 to 4500 MHz.  
8. Verify that the sample crosstalk is out of the noise floor. | -26dB         |
| **Rise Time**                 | 1. Minimize skew (see NOTE 1).  
2. Set the Time Domain Reflectometer (TDR) pulsers in differential mode with a positive going pulse (V+) and a negative going pulse (V-). Define a reflected differential trace on the receive channels as: \( V_{\text{diff}} = V_+ - V_- \). | 85 ps         |
3. With the TDR connected to the risetime reference trace measure and record the input risetime. Verify that the input risetime is between 25-35 ps (measured 20% - 80% Vp) see NOTE 2.
4. Remove the reflected trace definition.
5. Connect the TDR to the sample measurement traces.
6. Define a differential trace on the receive channels as: \( V_{\text{diff}} = V_+ - V_- \).
7. Measure (measured 20%-80% Vp) and record the output risetime.

### Inter-symbol Interface

1. K – 28.5 signal source running at 1.5 Gb/sec. The average position of zero crossing should not move more than specified value.

### Intra-Pair Skew

1. Set one of the Time Domain Reflectometer (TDR) pulsers in differential mode with a positive going pulse (V+) and a negative going pulse (V-).
2. With the TDR connected to the risetime reference trace verify an input risetime of 70ps (measured 20%-80% Vp). Filtering may be used to slow the system down (see NOTE 2).
3. Measure propagation delat (50% of Vp) of each line in a pair single-endedly. The skew equals the difference between each single ended propagation delay.

**NOTES:**

1. Skew must be minimized. Time domain measurement equipment allows for delay adjustment of the pulses so launch times can be synchronized. Frequency domain equipment will require the used of phase matched fixturing. The fixturing skew should be verified to be <1 ps on a TDR.
2. The system risetime is to be set via equipment filtering techniques. The filter risetime is significantly close to the stimulus risetime. Therefore the filter programmed equals the square root of \( (t_{\text{r (observed)}})^2 - (t_{\text{r (stimulus)}})^2 \). After filtering, verify the risetime is achieved using the risetime reference traces on the PCB fixture.
3. Calibrate the system by substituting either precision 50? loads for the test fixture. This places the calibration plane directly at the input interface of the test fixture.
4. A network analyzer is preferred. If greater dynamic range is required a signal generator/spectrum analyzer may be used. Differential measurements require the used of a four port network analyzer although baluns or hybrid couplers may be used.

5.0 SAMPLE SELECTION:
Samples shall be prepared in accordance with applicable manufacturer’s instructions and shall be selected at random from current production. Each test group shall provide 100 data points for a good statistical representation of the test result. For a connector with greater than 20 pins, a test group shall consist of a minimum of five connector pairs. From these connector pairs, a minimum of 20 contact pairs per mated connector shall be selected and identified. For connectors with less than 20 pins, choose the number of connectors sufficient to provide 100 data points.

Test Sequence
Table 5.1 shows the connector test sequences for five groups of tests.

NOTE:
(a) Preconditioning, 20 cycles for the 50 durability cycle requirement, 50 cycles for the 500 durability cycle requirement. The insertion and removal cycle is at the maximum rate of 200 cycles per hour.

For example, in Test Group A, one would perform the following tests:
1. Examination of the connector(s)
2. LLCR
3. Durability
4. LLCR
5. Examination of the connector(s)
